# Dual ±25V Above- and Below-the-Rails 4:1 Analog Multiplexer

## **General Description**

The MAX14778 dual 4:1 analog multiplexer supports analog signals up to ±25V with a single 3.0 to 5.5V supply. Each multiplexer has separate control inputs to allow independent switching, making the device ideal for multiplexing different communications signals with the same connector pins. Extended ESD protection of ±6kV (Human Body Model) enable direct interfacing to cables and connectors.

The MAX14778 features a low 1.5 $\Omega$  (max) on-resistance and 3m $\Omega$  (typ) flatness to maximize signal integrity over the entire common-mode voltage range. Each multiplexer can carry up to 300mA of continuous current through the multiplexer in either direction.

The MAX14778 supports switching of full-speed USB 1.1 signals (12Mbps) and RS-485 data rates of up to 20Mbps.

The MAX14778 is available in a 20-pin (5mm x 5mm) TQFN package and is specified over the -40°C to +125°C industrial temperature range.

## **Applications**

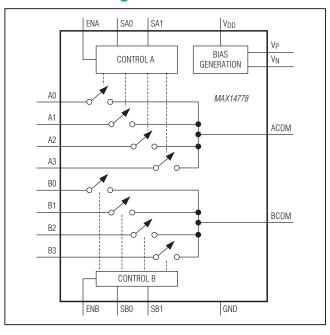

- RS-485/RS-232/USB 1.1 Multiplexing
- POS Peripherals
- Handheld Industrial Devices
- Communication Systems
- Audio/Data Multiplexing
- Connector Sharing
- Gaming Machines

Ordering Information appears at end of data sheet.

#### **Benefits and Features**

- Wide Signal Range Supported from Single-Supply Voltage Eliminates Negative Power Supply
  - ±25V Signal Range
  - Single 3.0V to 5.5V Supply
- Two Independent Multiplexers
  - · Break-Before-Make Operation
  - 1.5Ω R<sub>ON</sub> (max)
  - 3mΩ R<sub>ON</sub> Flatness (typ)
  - · 300mA Maximum Current Through Multiplexer
  - 78pF Input Capacitance
  - · 75MHz Large-Signal Bandwidth
  - 20-Pin TQFN (5mm x 5mm) Package
- Extended ESD Protection on A and B Pins
  - · ±6kV Human Body Model (HBM)

## **Functional Diagram**

# Dual ±25V Above- and Below-the-Rails 4:1 Analog Multiplexer

## **Absolute Maximum Ratings**

(All voltages referenced to GND.)	Continuous Current Through Switch±500mA
V <sub>DD</sub> 0.3V to +6V	Continuous Power Dissipation (T <sub>A</sub> = +70°C)
$V_P$ 0.3V to the lesser of +52V and ( $V_N$ + 70V)	TQFN (derate 33.3mW/°C above +70°C)2666.7mW
$V_N$ The lesser of ( $V_{DD}$ - 40V) and ( $V_P$ - 70V) to +0.3V	Operating Temperature Range40°C to +125°C
V <sub>P</sub> to V <sub>N</sub> 0.3V to +70V	Junction Temperature+150°C
ENA, ENB, SA , SB	Storage Temperature Range65°C to +150°C
A , ACOM, B ,	Lead Temperature (soldering, 10s)+300°C
BCOM( $V_N$ - 0.3V) to the lesser of ( $V_P$ + 0.3V) and ( $V_N$ + 52V)	Soldering Temperature (reflow)+260°C

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## **Package Information**

PACKAGE TYPE: 20 TQFN				
Package Code	T2055+4			
Outline Number	21-0140			
Land Pattern Number	90-0009			
THERMAL RESISTANCE, FOUR-LAYER BOARD				
Junction to Ambient (θ <sub>JA</sub> )	30°C/W			
Junction to Case (θ <sub>JC</sub> )	2°C/W			

For the latest package outline information and land patterns (footprints), go to <a href="www.maximintegrated.com/packages">www.maximintegrated.com/packages</a>. Note that a "+", "#", or "-" in the package code indicates RoHS status only. Package drawings may show a different suffix character, but the drawing pertains to the package regardless of RoHS status.

Package thermal resistances were obtained using the method described in JEDEC specification JESD51-7, using a four-layer board. For detailed information on package thermal considerations, refer to www.maximintegrated.com/thermal-tutorial.

## **Electrical Characteristics**

 $(V_{DD} = 3.0 \text{V to } 5.5 \text{V}, T_A = -40 ^{\circ}\text{C} \text{ to } +125 ^{\circ}\text{C}, \text{ unless otherwise noted.}$  Typical values are at  $V_{DD} = 5 \text{V}, T_A = +25 ^{\circ}\text{C}.)$  (Note 1)

## **Detailed Description**

The MAX14778 dual 4:1 analog multiplexer integrates bias circuitry to provide a ±25V analog voltage range with a single 3.0 to 5.5V supply. This extended input range allows multiplexing different communications signals such as RS-232, RS-485, audio and USB 1.1 onto the same connector.

#### **Integrated Bias Generation**

The MAX14778 contains a total of three charge pumps to generate bias voltages for the internal switches: a 5V regulated charge pump, a positive high-voltage (+35V) charge pump, and a negative high-voltage (-27V) charge pump. When  $V_{DD}$  is above 4.7V (typ), the 5V regulated charge pump is bypassed and  $V_{DD}$  provides the input for the high-voltage charge pumps, reducing overall supply current.

An external 100nF capacitor is required for each high-voltage charge pump between  $V_P/V_N$  and GND.

#### **Analog Signal Levels**

The MAX14778 transmits signals of up to  $\pm 25$ V with a single 3.0 to 5.5V supply due to integrated bias circuitry. The device features 1.5 $\Omega$  (max) on-resistance and 3m $\Omega$  (typ) flatness for analog signals between -25V and +25V (see the *Typical Operating Characteristics*). The current flow through the multiplexers can be bidirectional, allowing operation either as a multiplexer or demultiplexer.

Table 2. MUX B Channel Selection

0	Х	Χ	Open
1	0	0	В0
1	0	1	B1
1	1	0	B2
1	1	1	B3

X = Don't care

### **Digital Interface**

The MAX14778 has two digital select inputs for each MUX: SA1 and SA0 control MUX A; SB1 and SB0 control MUX B. Drive the digital select inputs high or low to select which input (A\_, B\_) is connected to the common terminal (ACOM, BCOM) for each MUX. See the <u>Truth Tables</u> for more information.

Each MUX features an independent enable input (ENA and ENB). Drive ENA or ENB low to disconnect all inputs from the common terminal for that MUX, regardless of the status of the select inputs or the other enable input.

### **Applications Information**

#### **Connector Sharing**

The MAX14778 supports a ±25V analog signal range independently for each input/output, allowing physical connector sharing between interface types that have differing signal ranges.

The multiprotocol connector-sharing application in the <u>Typical Operating Circuits</u> shows an application with RS-232, half-duplex RS-485, full-speed USB 1.1, and audio signals sharing the same connector. The device allows signals to pass over the entire signal range specified by each standard while safely isolating the unused transceivers.

# Dual ±25V Above- and Below-the-Rails 4:1 Analog Multiplexer

#### **Non-Powered Condition**

The MAX14778 can tolerate input voltages on the A\_, B\_, ACOM, and BCOM pins in the ±25V range when it is not powered.

When VDD = 0V, the DC input leakage current into the A\_, B\_, ACOM or BCOM pins will typically be below  $1\mu$ A. Some devices can have a larger leakage current up to mA range due to technology spread.

With VDD not powered, internal diodes between the analog pins and the VP and VN will charge up the external capacitors on VP and VN when positive and/or negative voltages are applied to these pins. This causes transient input current flow.

Large dv/dt on the inputs causes large capacitive charging currents, which have to be limited to the 300mA Absolute Maximum Ratings in order to not destroy the internal diodes. With 100nF capacitors on VP and VN, the dv/dt must be limited to 3V/µs once the capacitors reach their final voltage; the input current decays to the leakage current levels mentioned above.

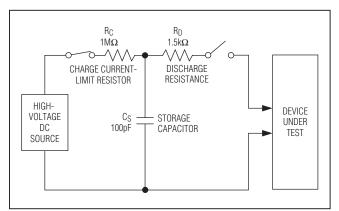

Figure 7. Human Body ESD Test Model

#### **High-ESD Protection**

Electrostatic discharge (ESD)-protection structures are incorporated on all pins to protect against electrostatic discharges up to  $\pm 2 \text{kV}$  Human Body Model (HBM) encountered during handling and assembly. A\_ and B\_ are further protected against ESD up to  $\pm 6 \text{kV}$  (HBM) without damage. The ESD structures withstand high ESD both in normal operation and when the device is powered down. After an ESD event, the MAX14778 continues to function without latchup.

#### **ESD Test Conditions**

ESD performance depends on a variety of conditions. Contact Maxim for a reliability report that documents test setup, test methodology, and test results.

The MAX14778 requires a 100nF capacitor on both  $V_P$  and  $V_N$  to GND to guarantee full ESD protection.

#### **Human Body Model**

Figure 7 shows the Human Body Model. Figure 8 shows the current waveform it generates when discharged into a low impedance. This model consists of a 100pF capacitor charged to the ESD voltage of interest that is then discharged into the device through a 1.5kΩ resistor.
